## EDUCATION

### Ph.D. Chemistry

**University of Illinois at Urbana-Champaign**, September 2013–December 2019  
Advisor: Prof. Benjamin J. McCall  
GPA 4.00/4

*Dissertation Title:* Sensitive and High-Precision Rovibrational Spectroscopy of Molecular Ions Relevant to Astronomical and Quantum Chemistry

*Dissertation research:* I improved the sensitivity of the sub-Doppler ion-sensitive technique Noise-Immune Cavity-Enhanced Optical Heterodyne Velocity Modulation Spectroscopy by more than an order of magnitude, which enabled the most extensive high-precision survey of  $\text{H}_3^+$  rovibrational transitions to date. This led to the most accurate predictions of the forbidden rotational spectrum, including a possible astrophysical maser. The derived ground-state energy levels are important benchmarks for *ab initio* theory, and my results will act as a stringent test for the foreseeable future. I also investigated the molecular ions  $\text{OH}^+$  and  $\text{D}_2\text{H}^+$  to accurately determine THz transition frequencies from their infrared spectra, which opens up the possibility for observations with modern THz observatories. This work resulted in 8 publications and 24 presentations.

*Research:* Carried out experiments using matrix isolation instrumentation to investigate the reactivity and stability of molecules trapped in water ices relevant to the surface chemistry of icy moons in the outer solar system. This work resulted in 1 publication.
